

Emscripten Windows Command Prompt (emcmdprompt.bat)

The *Emscripten Command Prompt* is used to call Emscripten tools from the command line on Windows.

The prompt can be launched from the file system by locating and opening the file **emcmdprompt.bat**.

Note

The *Emscripten Command Prompt* is configured with the correct system paths and settings to point to the [active](#) Emscripten tools. From within the prompt you can call [emsdk](#) to change the current SDK or tools.

Command line syntax

The tool is not *intended* to be run from an existing command line prompt.

However, if **emcmdprompt.bat** is called on the command line, a nested Emscripten command prompt is spawned within the current prompt (note that this is not necessarily obvious). You can then use this prompt to access the SDK tools. To exit the nested command prompt, type **exit** and then press the **Enter** key.
